ACCESSION NR: AP4042776

S/0020/64/157/003/0503/0505

AUTHORS: Akilov, G. P.; Rubinov, A. M.

TITLE: Successive approximation method for finding a best-approximation polynomial

SOURCE: AN SSSR. Doklady\*, 1964, v. 157, no. 3, 1964, 503-505

TOPIC TAGS: approximation method, polynomial, linear programming, convergent series, successive approximation method, normal space

ABSTRACT: The best approximation (a number  $\mu$ ) is defined as the lowest value of a polynomial  $P$ , which is determined by solving a series of auxiliary problems, using for example linear programming methods. A scheme of constructing the best-approximation polynomial is described. The sequence of polynomials  $\{P_m\}$  obtained during the course of the solution generates a sequence of least approximations  $\{\mu_m\}$ . If  $X$  is a normalized space (on the field of all real or all

ACCESSION NR: AP4042776

complex numbers, then the following theorem is proved: The sequence  $\{\mu_m\}$  converges to  $\mu$ . The sequence  $\{P_m\}$  is bounded (in the space X). If  $\{P_{m_i}\}$  is an arbitrary convergent sub-sequence of the sequence  $\{P_m\}$ , then

$$Q = \lim_{i \rightarrow \infty} P_{m_i}$$

is the best-approximation polynomial. If the best-approximation polynomial Q is unique, then the sequence  $\{P_m\}$  itself converges to Q. Some particular cases are pointed out. Orig. art. has: 5 formulas. Presented by Academician V.I. Smirnov.

Title : Changes of the Venous Perivascular Bed in Endarteritis

Orig Pub: Vestn. khirurgii, 1956, 77, No. 9, 73-85

Abstract: The venous perivascular bed in the areas of the neuro-vascular bundles of the leg and foot was studied in 25 amputated extremities of patients suffering from endarteritis. A decrease of the arterial perivascular bed was observed - at first of spastic nature, later due to hyalihosis and thrombosis of the arteries. The veins of the perivascular and intervascular venous tracts of the perineurium, and the transverse venous anastomoses increased, they emptied themselves

Abstr Jour: Ref Zhur ~ Biol., No 19, 1958, 68459

**Abstract:** in the intervascular venous tract, and formed enormous venous sleeve-like structures around arteries of any caliber. These venous sleeves, surrounding the arteries, received numerous venous branches from the arterial wall. The changes of the venous network in the arterial adventitia were minor, but in the tunica media they were considerable: A markedly dilated venous plexus, the character of which changed along the length of the blood vessel; the venous outflow from this network took place through transverse venous anastomoses of the arterial adventitia. The degree of dilation of the venae venorum was insignificant as compared with the dilation of the venae arteriorum. -- I. B. Barabash

AUTHOR VILENKH N.Ja, AKIM E.L., LEVIN A.A.  
TITLE Matrix elements of irreducible unitary representations of the group of Euclidean motions of a three-dimensional space and their properties.  
PERIODICAL Doklady Akad. Nauk 112, 987-989 (1957)  
reviewed 6/1957

At the Third Mathematical Union Congress Radov has presented an address on the computation of the matrix elements of the irreducible unitary representations of the group  $M(3, R)$  of the Euclidean motions of a three-dimensional space. The authors carry out the computation of the same elements with the aid of an integral method. Here certain functions are appearing which satisfy certain relations which can be denoted as generalizations of well-known relations between Bessel functions. The authors give a theorem of addition and recurrence formulas for these functions which originate in it.

TITLE: Determination of the lunar gravity field using the data on motion of the lunar artificial satellite "Luna-10"

SOURCE: Kosmicheskiye issledovaniya, v. 4, no. 6, 1966, 823-826

TOPIC TAGS: lunar satellite, artificial satellite orbit, moon gravity / Luna-10 lunar satellite

SUB CODE: 22,03

## ABSTRACT:

The article cited below gives the preliminary results of determination of the non-central character of the moon's gravity field on the basis of observational data on motion of the lunar artificial satellite "Luna-10." It was found that the non-central character of the field is an important factor determining the evolution of the satellite orbit. The perturbation of the satellite orbit, arising due to the non-central character of the lunar gravity field, is manifested particularly clearly in the evolution of the longitude  $\Omega$  of the ascending node of the satellite and the angular distance  $\omega$  of periselene from the node. The evolution of the parameters  $\Omega, \omega$  contains a clearly expressed secular deviation, leading to regression of both parameters. In 460 revolutions of the satellite around the moon the perturbations of the parameters  $\Omega, \omega$  caused by the non-central character of the moon's gravity field attain the values

Card 1/3

*09281336*

ACC NR: AP7007596

$$\Delta\omega = -7^\circ.7, \Delta\omega = -11^\circ.8.$$

Perturbations of inclination of the satellite orbit and its eccentricity for the most part have a periodic character and have the amplitude

$$\Delta i \approx 0^\circ.15, \Delta e \approx 0.003.$$

The orbital perturbations of the satellite due to the non-central character of the lunar field lead to perturbations in its coordinates; in one satellite revolution attaining the value

$$|\Delta r| \approx 0.75 \text{ km.}$$

The gravitational influence of the earth and sun on the motion of the artificial lunar satellite also lead to evolution of its orbit. This influence causes regression of the node and orbital pericenter of the satellite. During the active lifetime of the satellite these perturbations are

$$\Delta\Omega = -1^\circ, \Delta\omega = -2^\circ.$$

Card 2/3

ACC NR: A7007596

The perturbations due to a non-central gravity field of the moon exceed by 5-6 times the perturbations caused by the gravitational influence of the sun and moon. Analysis of trajectory measurements yielded numerical values for eleven coefficients of expansion of lunar gravity potential.

TITLE: Determining the gravitational field of the Moon by the artificial Moon  
satellite Luna-10

SOURCE: AN SSSR. Doklady, v. 170, no. 4, 1966, 799-802

TOPIC TAGS: Moon, gravitational field, Moon artificial satellite, gravitational potential

ABSTRACT: To determine the noncentral gravitational field of the Moon, the motion of the artificial Moon satellite "Luna 10" is analyzed with gravitational forces of the Earth and the Sun taken into account. From the statistically processed measurements of the trajectory of Luna-10 carried out over the period of its existence (from April 3 to May 30, 1966), it is established that the effect of noncentrality of the gravitational field of the Moon is an essential factor in the evolution of the orbit of Luna-10. The perturbations of its circumlunar orbit due to noncentrality of the gravitational field of the Moon are particularly noticeable in the evolution of the longitude of the ascending node  $\Omega$  and the angular distance of the pericenter to the ascending node  $\omega$ . The perturbations of elements  $\Omega$  and  $\omega$  of Luna-10 during the time of its existence (460 revolutions) due to noncentrality of the gravitational field

Card 1/2

L 04572-67

ACC NR: AP6033266

of the Moon and due to gravitational effects of the Earth and the Sun (the gravitational effects of other planets are neglected) are presented as functions of the number of revolutions of the Moon satellite. A comparison of the results shows that perturbations for Luna-10 due to noncentrality of the gravitational field of the Moon exceed the perturbations due to gravitational forces of the Earth and the Sun 5 to 6 times. The gravitational potential of the Moon is taken in the form of expansion in spherical functions with unknown coefficients (the gravitational field parameters)  $C_{nm}$  and  $d_{nm}$  ( $n = 2, 3, \dots$ ,  $m = 0, 1, \dots, n$ ). As a result of processed measurement data, the numerical values for eleven expansion coefficients are derived which are presented with maximum possible errors. To illustrate the determined gravitational potential of the Moon, the level surface passing through the point with spherical coordinates  $r = 1738$  km,  $\psi = 0$ ,  $\lambda = 0$  is analyzed. The level lines obtained by intersecting this surface by the equatorial plane of the Moon, the zero meridian plane ( $\lambda = 0$ ), and the plane corresponding the meridian  $\lambda = 90^\circ$  are presented. Orig. art. has: 4 figures.

Nitrocellulose lacquers from wood pulp. L. E. Akim  
and A. S. Komplev. Za Lakokrasochnyi Ind. 1934, No.  
2, 17-19. — By a method of combined bleaching and inter-  
mediate treatment with NaOH under pressure, com. un-  
bleached sulfite pulp gave a product with 95.0%  $\alpha$ -cellu-  
lose, Cu no. less than 0.5 and ash content under 0.2%.  
When nitrated and stabilized, it yielded 130-50% of  
nitrocellulose contg. 11.2-11.6% N, completely sol. in the  
above Et<sub>2</sub>O mixt. and having a viscosity lower than that of  
acetone nitrocellulose. For the production of coloxylin  
with a viscosity of 1° (American method), addnl. rework-  
ing in an autoclave was required. By a method of mild  
bleaching with Cl, coloxylia suitable for production of  
colorless lacquers was obtained. Comparative exposure  
tests showed that lacquers obtained from the wood pulp are  
equal to those produced from hinters. The process was  
successfully used on a com. scale. Chas. Blanc

**Preparation of lacquers from wood colloxylin II.**  
 L. E. Akim and V. V. Zhebrovskii. *J. Applied Chem. (U. S. S. R.)*, 9, 1090-1095 (1936).—The Vansag Co. film prep. method (cf. C. A. 26, 5438) was used. The films were tested in the Schopper app. (cf. U. S. pat. 1,707,774; C. A. 25, 2003). Lacquer films obtained from wood nitrocellulose have: a rupture modulus of 317-410 kg./sq. cm., elongation at break 3.7%, av. thickness 0.100-1.100 mm., viscosity of 0.02-11.47%, drops/sec., and Ni content of 0.02-11.48%. Treatment of wood nitrocellulose in an autoclave lowers its viscosity and decreases the strength of the film. The stability of the wood, nitrocellulose (colored and pigmented varieties) films on Fe plates is not lower than that obtained from the cotton filter. The use of wood cellulose as raw material for high-quality nitrolacquer is quite feasible. Bxptl. data are tabulated. Ten references.

		<p><b>Beneficiation of wood pulp in bleaching drums.</b> <i>J. M. Akim, Tsentral. Nauch.-Issledovat. Inst. Bumarkof-Prom., Materialy No. 31, 3-11(1940).</i>—Soft and medium hardwood sulfite pulp can be beneficiated in 2 stages in a bleaching drum. For soft pulp the following conditions are suggested. In the first stage the use of active Cl should amt. to 40% of that required for a one-stage procedure. Alk. treatment for 3 hrs. with a 1% NaOH with the mixt. concn. at 6% and the temp. not lower than 85°. Alk. treatment is followed by washing with cold H<sub>2</sub>O for 2 hrs. after which there is an addnl. bleaching for 2-3 hrs. at 15°. Consumption of active Cl is 1% by wt. of fibers. The mixt. is then washed with cold H<sub>2</sub>O for 1-2 hrs., then acid-treated for 30 min. with 0.2% H<sub>2</sub>SO<sub>4</sub> and finally washed with cold H<sub>2</sub>O for 2-3 hrs. The consumption of NaOH amts. to 20% by wt. of the fibers but this can be reduced to 8-10% by using the spent alkali from the first drum in the second. In addn., 30% of the NaOH can be replaced with Ca(OH)<sub>2</sub>. In expts. in which Ca(OH)<sub>2</sub> was used the yield of <math>\alpha</math>-cellulose was 91.02%. For pulp of medium hardness the following conditions are suggested. In the first stage the consumption of active Cl should be 40% of that required in the one-stage process. Alk. and acid treatments and the addnl. bleaching are the same as for the soft pulp.</p> <p style="text-align: right;">B. Z. Kamich</p>

TITLE: Modern Methods of Preparing Lignocellulose for  
Chemical Processing

PERIODICAL: Khimicheskaya nauka i promyshlennost' 1959, Vol 4,  
Nr 6, pp 698-705 (USSR)

ABSTRACT: This is a review of Soviet and foreign literature on  
the preparation of bleached cellulose for the artificial  
fibers, plastics, and explosives industries. GOST-5982-  
59 and 9104-59 norms of sulfite viscose cellulose for  
the manufacture of rayon staple fiber, yarn, and cord,  
and Swedish characteristics of high-strength cord are  
given in tables. Sulfite and sulfate digestion is  
described in detail. Sulfite-alkali, nitric acid, and  
other methods are briefly mentioned. Optimal conditions  
for sulfite digestions are as follows: temperature  
raised to 105-110° C within 3 to 4 hr and maintained  
for 1 to 2 hr; then raised to 140-142° C within 3 to 4 hr.

In recent times, calcium bisulfite was replaced with ammonium, sodium, or magnesium bisulfites, which remain stable and penetrate the wood much better than calcium bisulfite. Unbleached sulfite cellulose (viscose grade) obtained in about 46% yield (based on wood chips) contained about 1% residual lignin, 3 to 4% pentosans, and 89 to 90% C-cellulose; the mean degree of polymerization was 700 to 1,000. The degree of polymerization and the content of hemicellulose is regulated by the acidity of the liquor and the end temperature of the digestion. The acidity can be raised by removal of a part of the alkali; this reduces the amount of calcium bisulfite in the digester and increases the hydrolytic action of the liquor (Ye. A. Kuznetsov, New Technology of Sulfite Cellulose Manufacture--Novaya tekhnika v proizvodstve sul'fitnoy tsellyulozy--Goslesbunizdat, 1956, p 25). Sulfate digestion is conducted at higher temperatures than the sulfite process and takes less time; the temperature is raised to 168-174° C within 2 to 3 hr and is maintained at this level for 1 to 2 hr. The yield is

SOV/65-4-6-2/37

cellulose. It was tried successfully on aspen wood (V. S. Gromov, P. N. Odintsov, Mum. prom., 1957, Nr 6). Optimal conditions: 11-12 hr cooking at 150° C; yield 52% based on wood; 89-93%  $\alpha$ -cellulose; 0.01% ashes. The liquor can be reused 6 to 7 times; excess lignin (20% based on wood) is then separated, and the purified liquor used again. The mechanical purification and screening of the unbleached cellulose is described. The separation of 18.5% fine fibers raised the  $\alpha$ -cellulose content from 87.5% to 89.2%, lowered the lignin content from 3.07% to 0.47%, that of pentosans from 6.54% to 4.26%, and that of resins and ashes from 1.96% to 0.71%. The continuous bleaching of sulfite viscose cellulose is described in detail. The process consists of seven stages; namely: chlorination I; chlorination II; refining; wash; hypochlorite bleaching I; hypochlorite bleaching II; acidification. Recently, one or two stages of bleaching with ClO<sub>2</sub> follow the hypochlorite bleaching II when cellulose with a small lignin content is processed, and a

SOV/63-4-6-2/37

maximum bleaching effect (without damaging the fiber) is required. The refining (caustic extraction) is done with 0.5-1.0% NaOH at 95 to 140° C (hot refining) or 9-12% NaOH at normal temperature (cold refining). The content of resins and fats in bleached cellulose can be lowered considerably by adding surface active agents (OP-10, TMS, OP-7, and other) to the NaOH solution. The bleaching with sodium or potassium hypochlorite is conducted at pH = 9 to 10; t = 38 to 42° C; time of reaction 4 to 5 hr. Acidification is done with 1-2% sulfuric acid (by weight, based on the fiber); time of reaction, 50 to 60 min. Bleaching with ClO<sub>2</sub> is discussed. The bleaching can be made in basic, acid, or neutral medium. In an acid medium the oxidizing potential is fully utilized, according to the reaction:

Card 5/6

In alkaline medium only part of the oxidizing potential

Cellulose for Chemical Processing

77268  
SOV/63-4-6-2/37

is utilized:

This last reaction proceeds energetically and shows a high bleaching effect, but it reduces the viscosity and the mechanical characteristics of the cellulose. However, by bleaching in alkaline medium at pH  $\leq 10$ , one can omit the hypochlorite bleaching after the refining stage (Proceedings of the Leningrad Technological Institute of the Cellulose and Paper Industry--Trudy LTI cellyul. i bum. prom.--1955, Nr 3, p 3). There are 4 tables; 1 figure; and 77 references, 12 U.S., 3 U.K., 11 Swedish, 2 Finnish, 2 Japanese, 1 Polish, 10 German, 36 Soviet. Recent U.S. and U.K. references are: Cabbot, Purves, F. & P. Mag. of Canada, Nr 2 (1959); L. Joergensen, The Chemistry of Pulp Fibers (Symposium at Cambridge, September 1957); F. Walker, Paper Trade J., 140, Nr 35, 21 (1956); J. Evans, ibid., 133, Nr 31 (1954); W. Rapson, Paper Mill News, 78, Nr 13, 88 (1955).

TITLE: Peculiarities of integral stereoscopic filming and projection

PERIODICAL: Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, v. 8, no. 2, 1963, 92 - 97

TEXT: A stereocinematograph with a perspective screen and without spectacles has recently been developed at the stereolaboratory of НИКФИ (NIKFI). In integral stereoscopic filming and projection, a large number of pictures of the object are taken simultaneously and reproduced on the screen. The number of objectives is determined by the number of pictures in the series, which fix the object from various points simultaneously. The latter differ in very small parallaxes of two close projections of similar-image points. The step in the elementary areas and that of the objectives are chosen commensurably with the diameter of the eye-pupil. The viewing distance is chosen according to the resolving power of the observer's eye. It is almost unnecessary to choose a point of observation for the stereoscopic effect, whereby a "look around" effect of hitherto un-
